

# UltraVault: Email Compliance made simple

Companies' dependency on email to do business brings various problems with it. Storage, backups, problematic PST files, access to old emails and email related legal compliance, are some issues that arise. Failure to address them in an effective manner could have serious repercussions on your business. One way to address each problem with a single solution is to implement UltraVault for Exchange.

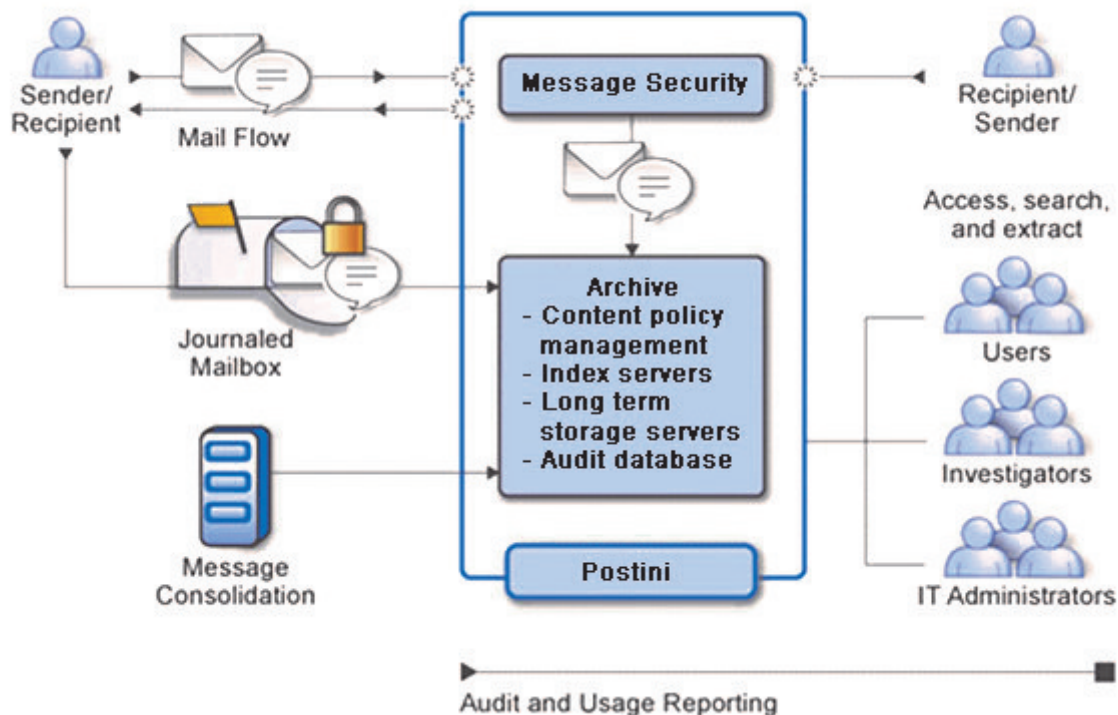

UltraVault for Exchange is based on Postini® which is the industry's leading provider of email security and management for the enterprise. This hosted service provides a comprehensive archiving solution that also includes Postini's® award winning anti virus and anti spam protection.

### With SMS' UltraVault services you will be able to:-

- create a centralised and searchable email repository for your organisation
- quickly search across the archive to find emails
- secure your email from spam, viruses, phishing, and other email-borne threats
- set central email policies to manage content and compliance requirements

This effective archiving solution stores all incoming and outgoing emails for 10 years without any storage limits and easy access to the archive via a web interface will allow administrators to pinpoint specific email without having to search multiple data sources. With the advanced web interface administrators can also allow end users to access their own archive without IT assistance. To ensure compliance, end users will not be able to change or delete emails in the archive.
